## INTRODUCTION

➤ Pinto peanut (*Arachis pinto* Krap. and Greg. cv. Amarillo) is a productive and grazing tolerant warm-season legume; however, the slow establishment is one of the main limitations of its use (Carvalho and Quesemerry, 2012).

➤ Bahiagrass (*Paspalum notatum* Flugge) is the most planted warm-season grass for beef cattle in Florida, and similarly to pinto peanut, it also takes an extensive time to establish (Gates and Mullahey, 1997).

➤ There is limited information in the literature about management practices to establish mixed swards of bahiagrass and pinto peanut.

➤ Nitrogen fertilization can have a positive effect on bahiagrass establishment (Busey, 1992), however, it can also affect botanical composition in grass-legume mixtures (Templeton and Taylor, 1966).

## OBJECTIVES

➤ To evaluate the establishment of bahiagrass and pinto peanut seeded alone or mixed with each other.

➤ To evaluate N fertilization effect on establishment characteristics.

## HYPOTHESIS

➤ Slow initial growth of both plants will minimize competition in early establishment.

➤ Greater N fertilization will benefit grass establishment.

## MATERIAL AND METHODS

➤ The experiment was conducted from June to October 2014 and 2015 at the UF/IFAS Range Cattle Research and Education Center, Ona, FL.

➤ Treatments were the split-plot arrangement of pinto peanut alone, bahiagrass alone or bahiagrass-pinto peanut mixtures (main plot, 4x4 m), with or without an extra 50 kg ha<sup>-1</sup> N fertilization (sub plot, 2x4 m), distributed in a complete randomized blocks design with four replicates.

➤ Seeding rates for bahiagrass and pinto peanut were 25 and 10 kg ha<sup>-1</sup>, respectively.

➤ All plots were fertilized with 30, 13 and 25 kg ha<sup>-1</sup> of N, P, and K 15 d after seeding. Extra N was applied 32 d after seeding.

➤ Every 28 d, plots were mowed at 10 cm stubble height, for weed control.

➤ Plant density and frequency were evaluated every 28 d (month) while ground coverage and herbage mass proportion were evaluated only at the end of each year.

➤ Data was analyzed using PROC MIXED of SAS with treatment and month as fixed effects. Means were considered different when  $p < 0.10$ .

## RESULTS AND DISCUSSION

### Density and Frequency

➤ Density of bahiagrass was only affected by seeding strategy ( $p < 0.09$ ; Table 1). Conversely, density of pinto peanut was not affected by either seeding strategy ( $p > 0.35$ ; Table 1) or month ( $p > 0.12$ ), but was affected by N ( $p < 0.07$ ; Table 2).

**Table 1. Effect of seeding strategy on response variables of bahiagrass and pinto peanut.**

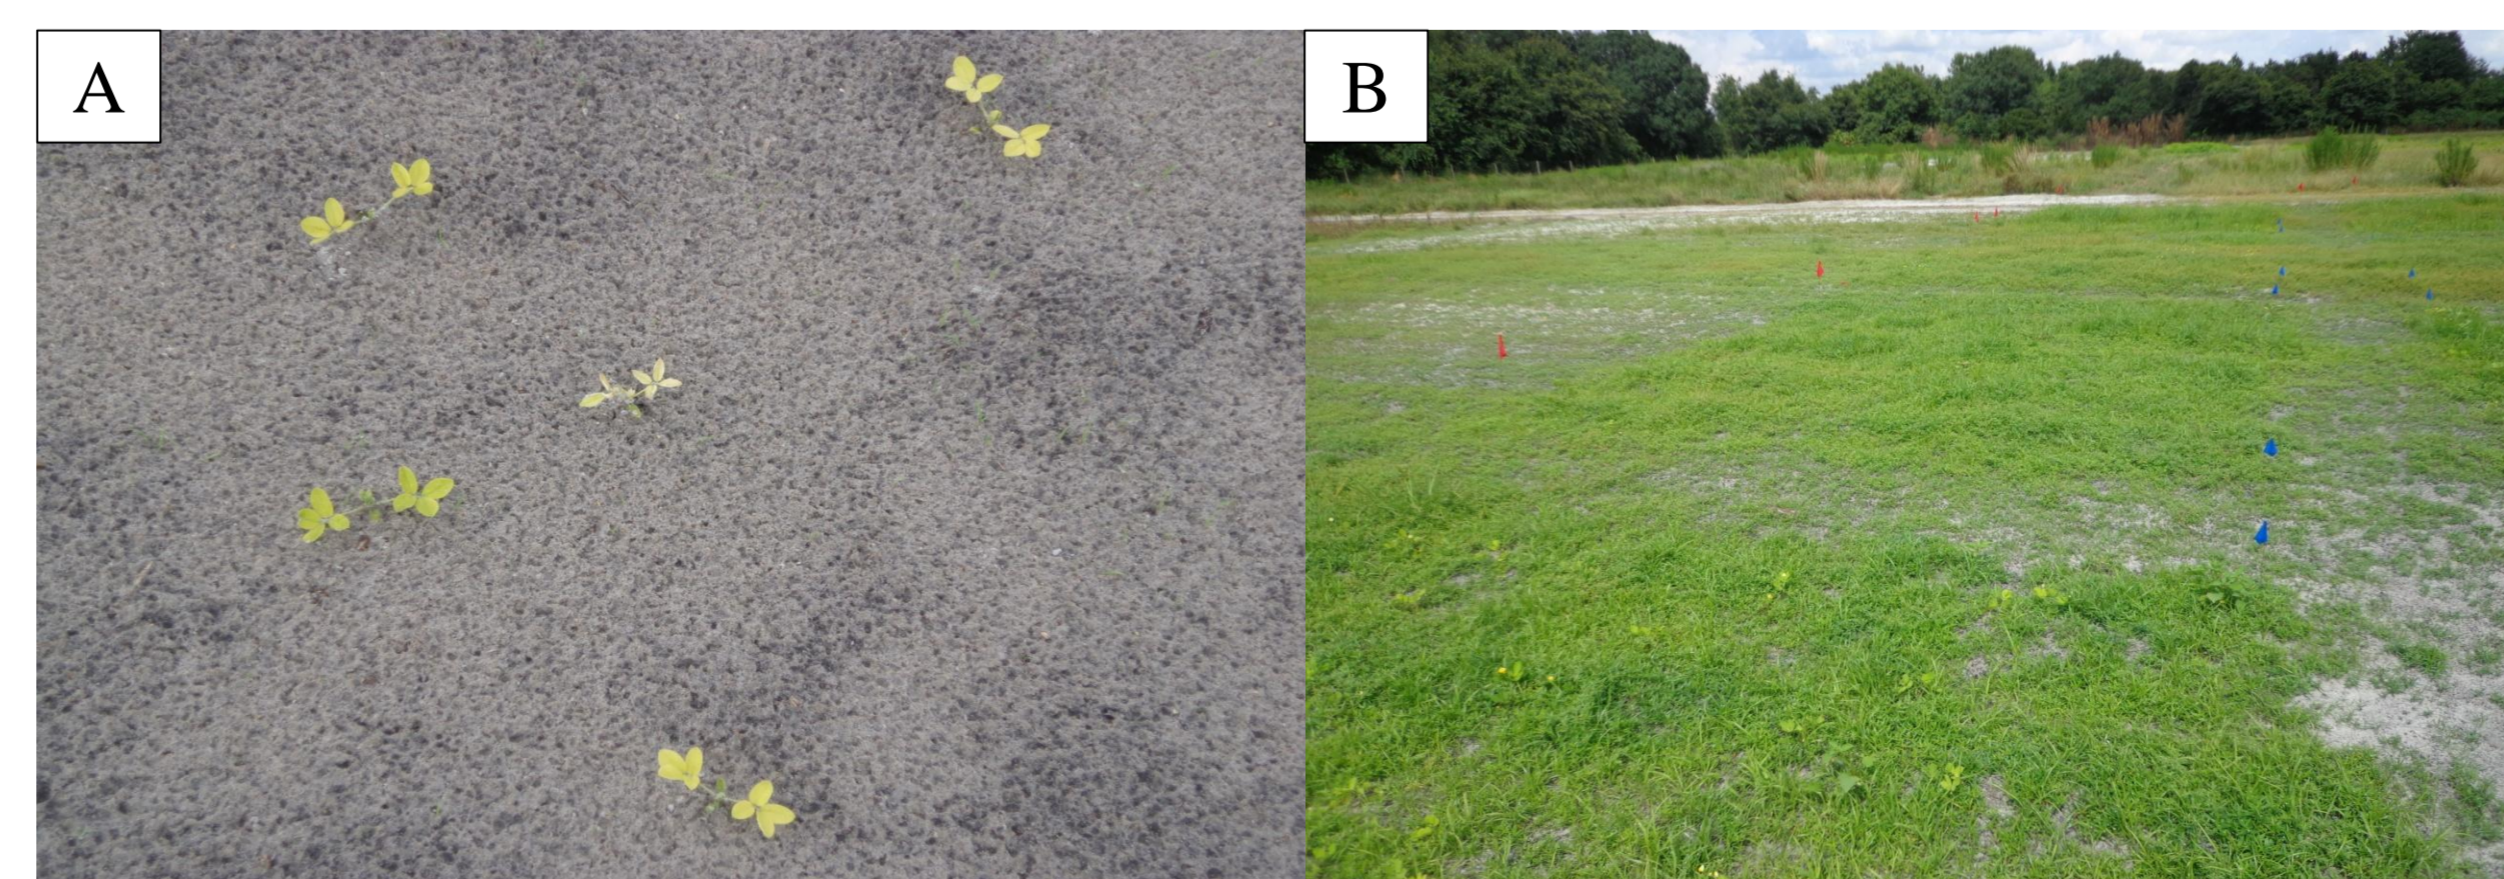

| Variables                               | Seeding strategy |         | SE <sup>1</sup> | p-value      |
|---|------------------|---------|-----------------|--------------|
|   | Plant alone      | Mixture |                 |              |
| Bahia Density (plants m <sup>-2</sup> ) | 50.9             | 39.6    | 7.26            | <b>0.09*</b> |
| Bahia Frequency                         | 38.8             | 36.8    | 5.52            | 0.13         |
| Bahia ground coverage (%)               | 17.9             | 13.9    | 3.96            | 0.28         |
| Bahia herbage mass proportion (%)       | 12.4             | 9.4     | 2.34            | 0.32         |
| Pinto Density (plants m <sup>-2</sup> ) | 6.6              | 5.7     | 0.70            | 0.35         |
| Pinto Frequency                         | 11.7             | 10.4    | 2.37            | 0.44         |
| Pinto ground coverage (%)               | 2.5              | 2.2     | 0.55            | 0.66         |
| Pinto herbage mass proportion (%)       | 1.2              | 1.4     | 0.29            | 0.62         |

<sup>1</sup>SE: Standard error.. \*Significantly different ( $p < 0.10$ ).

**Table 2. Effect of extra N fertilization on response variables of bahiagrass and pinto peanut.**

| Variables                               | Extra N (kg ha <sup>-1</sup> ) |      | SE <sup>1</sup> | p-value      |
|---|--------------------------------|------|-----------------|--------------|
|   | 0                              | 50   |                 |              |
| Bahia Density (plants m <sup>-2</sup> ) | 46.9                           | 43.6 | 7.14            | 0.58         |
| Bahia Frequency                         | 35.6                           | 36.8 | 5.45            | 0.64         |
| Bahia ground coverage (%)               | 14.8                           | 17.0 | 3.96            | 0.52         |
| Bahia herbage mass proportion (%)       | 8.2                            | 13.3 | 2.34            | <b>0.06*</b> |
| Pinto Density (plants m <sup>-2</sup> ) | 5.4                            | 6.8  | 0.64            | <b>0.08*</b> |
| Pinto Frequency                         | 9.9                            | 12.2 | 2.33            | <b>0.06*</b> |
| Pinto ground coverage (%)               | 2.6                            | 2.1  | 0.55            | 0.46         |
| Pinto herbage mass proportion (%)       | 1.4                            | 1.1  | 0.28            | 0.35         |

<sup>1</sup>SE: Standard error.. \*Significantly different ( $p < 0.10$ ).

**Figure 1. A - Pinto peanut seedlings; B - Experimental plots.**

➤ Frequency of both plants was affected by month ( $p < 0.01$ ; Figure 2). Pinto peanut frequency was also affected by N ( $p < 0.06$ ; Table 2).

**Figure 2. Frequency of bahiagrass and pinto peanut by month.**

<sup>1</sup>Different letters within each plant refer to significant difference among means ( $p < 0.10$ ).

## Herbage mass and ground coverage proportion

➤ Bahiagrass herbage mass proportion was only affected by N ( $p < 0.08$ ). Pinto peanut ground coverage proportion increased with N fertilization ( $p < 0.06$ ; Table 2).

➤ Bowman et al. (1998) reported that pinto peanut had greater ground coverage when it was planted alone than planted with bahiagrass (13.7 vs. 9.9%), however, planting method and period of evaluation was not the same as used in this experiment.

## CONCLUSION

➤ Intercropping bahiagrass-pinto peanut is more detrimental to bahiagrass than pinto peanut establishment.

➤ A second N fertilization can improve the establishment of both plants.
