Fungicide Programming for Dollar Spot Disease Control on Chicago Golf Fairways Collaborators: Dave Ward, Coyote Run Golf Course and Dan Dinelli, CGCS, North Shore Country Club Keith Rincker, Derek Settle, and Randy Kane

Introduction

This study was generated by a golf course superintendents' need to create a fungicide program to control dollar spot in fairways within a limited budget. Fungicide programs are composed of different strategies (preventative, curative, or both), timing, intervals, and rates. Fungicide application decisions impact their efficacy and cost. The objective of this study was:

1) Compare fungicide programs which rotate mode-of-action to target dollar spot disease (Sclerotinia homoeocarpa) on Chicago golf fairways 2) Compare programs that employ a curative, preventative, or a curative-preventative strategy mixture.

Materials and Methods

Two fairway locations in greater Chicago were used in this study.

- Coyote Run Golf Course, Flossmoor, IL (south suburb)
- 50:50 blend of 'L-93' and 'Shouthshore'
- North Shore Country Club, Glenview, IL (north suburb)
- Mixture of creeping bentgrass and Poa annua
- Partial resistance to DMI (e.g., Banner Maxx) and Dicarboximide (e.g., Chipco 26GT) fungicides.

Plots were 4ft x 6ft and arranged in a randomized complete block design with four replications. Fungicides were applied with a CO₂ backpack sprayer and 8004 nozzles at 40 psi in water equivalent to 2 gal/1000 ft². Dollar spot was visually estimated by rating percent plot area damaged. Visual quality was rated (0-9 scale, 9 best and 6 acceptable) to evaluate potential phytotoxic effects of treatments and determine if disease control was acceptable. Curative fungicides (treatments 3,4, and 5) were not applied until a 5% dollar spot damage threshold was achieved in at least one of four replicates. A minimum of 14 days occurred between each curative application. Costs of each fungicide were obtained from Coyote Run GC and used to calculate program costs. Programs were then compared by using Daconil Ultrex (14 day) as a standard of relative cost.

Chicago District Golf Association 11855 Archer Avenue, Lemont, IL 60439

¹ Area Under Disease Progress Curve summarizes 19 rating dates from 9 June to 13 Oct. Means not followed by the same letter are significantly different (P<0.05) by Fisher LSD. ² Area Under Curve summarizes 19 rating dates from 9 June to 13 Oct. Means not followed by the same letter are significantly different (P<0.05) by Fisher LSD. ³ Program costs are calculated using Daconil Ultrex (14 day) as a standard and basing each program as relatively more or less expensive.

Conclusion

Oollar spot disease pressure remained low during June of 2008. couting and tolerating low levels of dollar spot led some fungicide rograms to control dollar spot with few applications.

- Systemics provided longer control than expected during low isease pressure.
- Preventative 14 day programs required up to 11 applications in 2008. More applications are needed when fungicides are used on a fungal opulation that contains resistant strains.
- A product's costs/day of control is lessened when long control is rovided and utilized by scouting for new symptoms to develop.

he CDGA program utilized Emerald when dollar spot first appeared nd waited until symptoms reappeared. Then applications of Banner Maxx and Chipco GT are rotated. The last application is timed to utilize Emerald's long efficacy again during this low disease pressure. This program controlled dollar spot consistently with only 5 applications.

Other research points towards early applications of dollar spot control can delay the second application until June. However, the first symptoms of dollar spot do not develop ve rapidly and the first application can be saved until fungal conditions are favorable, therefore saving money. In 2008 and 2009 the first applications could have been in June without sacrificing quality.

- •The 3-way rotation program is an example of using low rates to save money.
- The CDGA program uses some curative applications and stretching the application interval to save money. The Coyote Run program uses curative applications and generic products to save money.
- This research was repeated in 2009 and similarly dollar spot development was delayed due to a cool weather.
