Pos doctoral student at ESALQ/USP; 5. Prof. Dr. FZEA/USP, Pirassununga-SP.

- Brazil → urea is the most used source of N in agriculture;

Figure 1. Fertilizers application and leaf sampled

Experiment:

- Randomized complete block (4 replications);
- No tillage;
- 100 kg ha⁻¹ of N applied in surface application in 2010 under corn residue and in 2011 under soybean residue.
- N sources: urea (U), urea + 15% (m/m) zeolite (UZ), ammonium nitrate (AN), urea coated with boric acid and copper sulfate (UC), mixes of ammonium sulfate (33.3%) + urea (66.7%) (AS+U) and ammonium sulfate (33.3%) + urea coated (66.7%) (AS+UC) and a control (without N).

Table 1. Production aspects evaluated

- Average productivity in 2009/10 (Contrast analyses, p<0.01) obtained superiority of 952 kg ha⁻¹ for treatments with urea compared to control.
- 2009/10 → Superiority of 816 and 644.4 kg ha⁻¹ for AS+UC and UC compared to other treatments with N (p<0.05).
- 2010/11 → There was no N fertilization effect compared to control and also for contrasts among N treatments.

- Effects of high soil fertility influenced by soybean residue and the climatic condition in 2010/11 resulted in low effects of the N treatments.
- Leaf N show effect of N fertilization (Table 2 and 3).

- ISNT detected no effect of N treatments however it detected high organic nitrogen levels (Figures 1 and 2).

Figures 2 and 3. Illinois Soil Nitrogen Test (ISNT) in soil 0-20 cm

In conclusion, in no tillage with high fertility soil under appropriate climatic condition showed lower capacity to distinguish different nitrogen fertilizers.
